# Facets (ggplot2)

## Problem

You want to do split up your data by one or more variables and plot the subsets of data together.

#### Solution

#### Sample data

We will use the tips dataset from the reshape2 package.

```
1!brary(reshape2)
# Look at first few rows
head(tips)
#> total_bill tip sex smoker day time size
#> 1 total_bill tip sex smoker day time size
#> 2 10.34 1.66 Male No Sun Dinner 2
#> 2 10.34 1.66 Male No Sun Dinner 3
#> 3 2.101.3.59 Male No Sun Dinner 3
#> 4 23.68 3.31 Male No Sun Dinner 3
#> 6 25.29 4.71 Male No Sun Dinner 4
```

This is a scatterplot of the tip percentage by total bill size.

```
library(ggplot2)
sp <- ggplot(tips, aes(x=total_bill, y=tip/total_bill)) + geom_point(shape=1)
sp</pre>
```

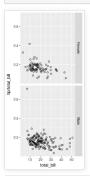

## facet\_grid

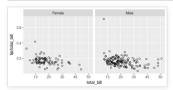

The data can be split up by one or two variables that vary on the horizontal and/or vertical direction.

This is done by giving a formula to  $facet\_grid()$ , of the form  $vertical \sim horizontal$ .

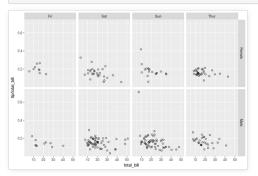

```
# Divide by levels of "sex", in the vertical direction
sp + facet_grid(sex ~ .)
```

# Divide by levels of "sex", in the horizontal direction  $sp + facet\_grid(. \sim sex)$ 

# Divide with "sex" vertical, "day" horizontal
sp + facet\_grid(sex ~ day)

# facet\_wrap

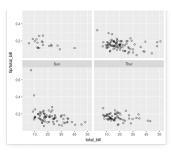

Instead of faceting with a variable in the horizontal or vertical direction, facets can be placed next to each other, wrapping with a certain number of columns or rows. The label for each plot will be at the top of the plot.

```
# Divide by day, going harizontally and wrapping with 2 columns
sp + facet_wrap( ~ day, ncol=2)
```

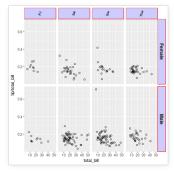

Problem
Solution
Sample data
facet\_grid

Sample data facet\_grid facet\_wrap Modifying facet label appearance Modifying facet label text Free scales

#### Modifying facet label appearance

```
sp + facet_grid(sex ~ day) +
theme(strip.rext.x = element_text(size=8, angle=75),
    strip.text.y = element_text(size=12, face="bold"),
    strip.background = element_rect(colour="red", fill="#CCCCFF"))
```

## Modifying facet label text

There are a few different ways of modifying facet labels. The simplest way is to provide a named vector that maps original names to new names. To map the levels of sex from Female==>Women, and Male==>Men:

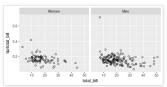

```
labels <- c(female = "Momen", Male = "Men")
sp + facet_grid(. ~ sex, labeller=labeller(sex = labels))
```

Another way is to modify the data frame so that the data contains the desired labels:

```
tips2 <- tips
levels(tips25sex)="female"] <- "Nomen"
levels(tips25sex)="wels(tips25sex)="Male"] <- "Nem"
head(tips2, 3)

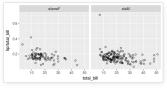

$\begin{align*} \text{total_bill tip sex smoker day time size} \\
$\begin{align*} 1 & 16.99 & 1.01 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 & 100 &
```

Both of these will give the same result:

labeller() can use any function that takes a character vector as input and returns a character vector as output. For example, the capitalize function from the Hmisc package will capitalize the first letters of strings. We can also define our own custom functions, like this one, which reverses strings:

```
# Reverse each strings in a character vector
reverse <- function(strings) {
    strings <- strsplit(strings, ")
    vapply(strings, function(x) {
        paster(rev(X), collapse = ")
    }, TUM.VALUE = character(:))
}
sp + facet_grid(. ~ sex, labeller=labeller(sex = reverse))</pre>
```

## Free scales

Normally, the axis scales on each graph are fixed, which means that they have the same size and range. They can be made independent, by setting scales to free\_x, or free\_y.

```
# A histogram of bill sizes

hp <- gaplot(tips, aes(x=total_bill)) + geom_histogram(binwidth=2,colour="white")

# Histogram of total_bill, divided by sex and smoker

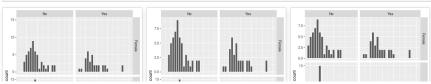

hp + facet_grid(sex - smoker)

# Same as above, with scales="free_y"

hp + facet_grid(sex - smoker, scales="free_y")

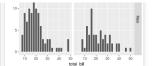

# Kith panels that have the same scaling, but different range (and therefore different physical sizes)

hp + facet_grid(sex - smoker, scales="free", space="free")
```
